## New Snow and Wind in Cooke City

Date Sun, 02/02/2025 - 13:10 Activity Skiing

Skied south of Cooke over the weekend. Winds were L-M gusting to X out of the W, SW. 19" HN at 8500' from Friday night to Sunday afternoon. Small, localized cracking of wind slabs, but they weren't as reactive as I would have expected. No avalanches seen, although visibility was limited. There are some density changes within the storm snow, including a layer of graupel. Storm snow was not reactive in hand pits. On solar aspects, there is a MF crust under the recent storm snow and facets under the crust. The crust varies in thickness depending on aspect and elevation, 1-3cm.

Region Cooke City Location (from list) COOKE CITY Observer Name Beartooth Powder Guides
